Overview

- **The problem:** Why Internet privacy and DNS Privacy are important (DNS leakage)
- **Recent Progress:** Chart progress during last 3-4 years (DPRIVE) in open standards and open source software
- **Where are we now?** Present current status and tools

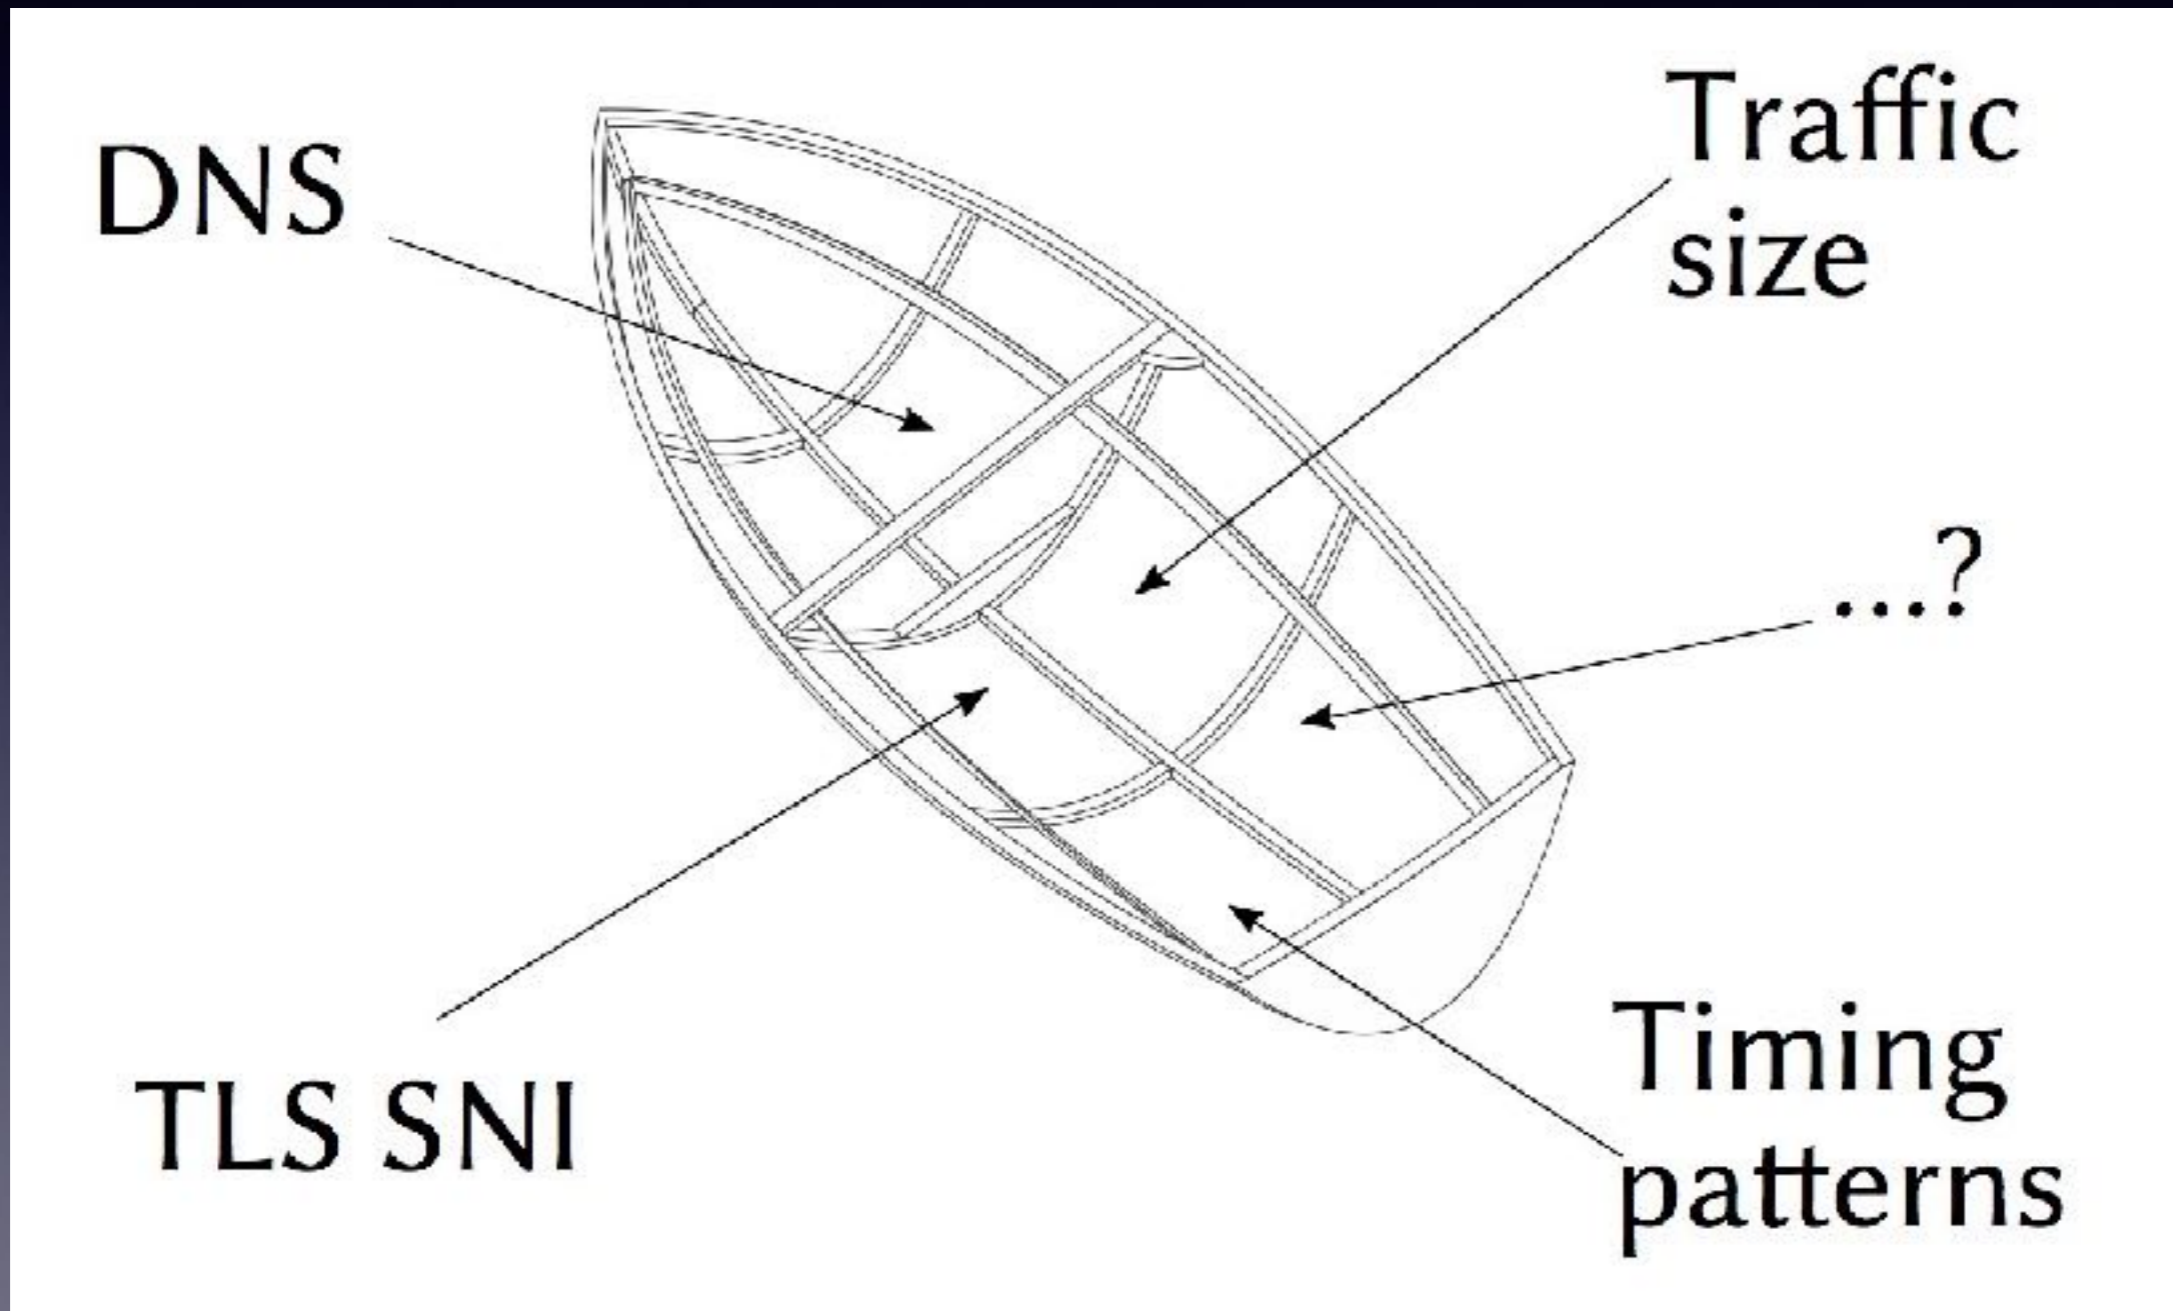

IETF Open Standards and Privacy

March 2011	I-D: Privacy Considerations for Internet Protocols (IAB)
June 2013	 Snowden revelations What timing!
July 2013	<u>RFC6973</u> : Privacy Considerations for Internet Protocols
May 2014	<u>RFC7258</u> : Pervasive Monitoring is an Attack: “PM is an attack on the privacy of Internet users and organisations.”

DNS Privacy

- A brief history

DNS is part of the Internet 'leaky boat' problem

DNS Privacy (in 2013)

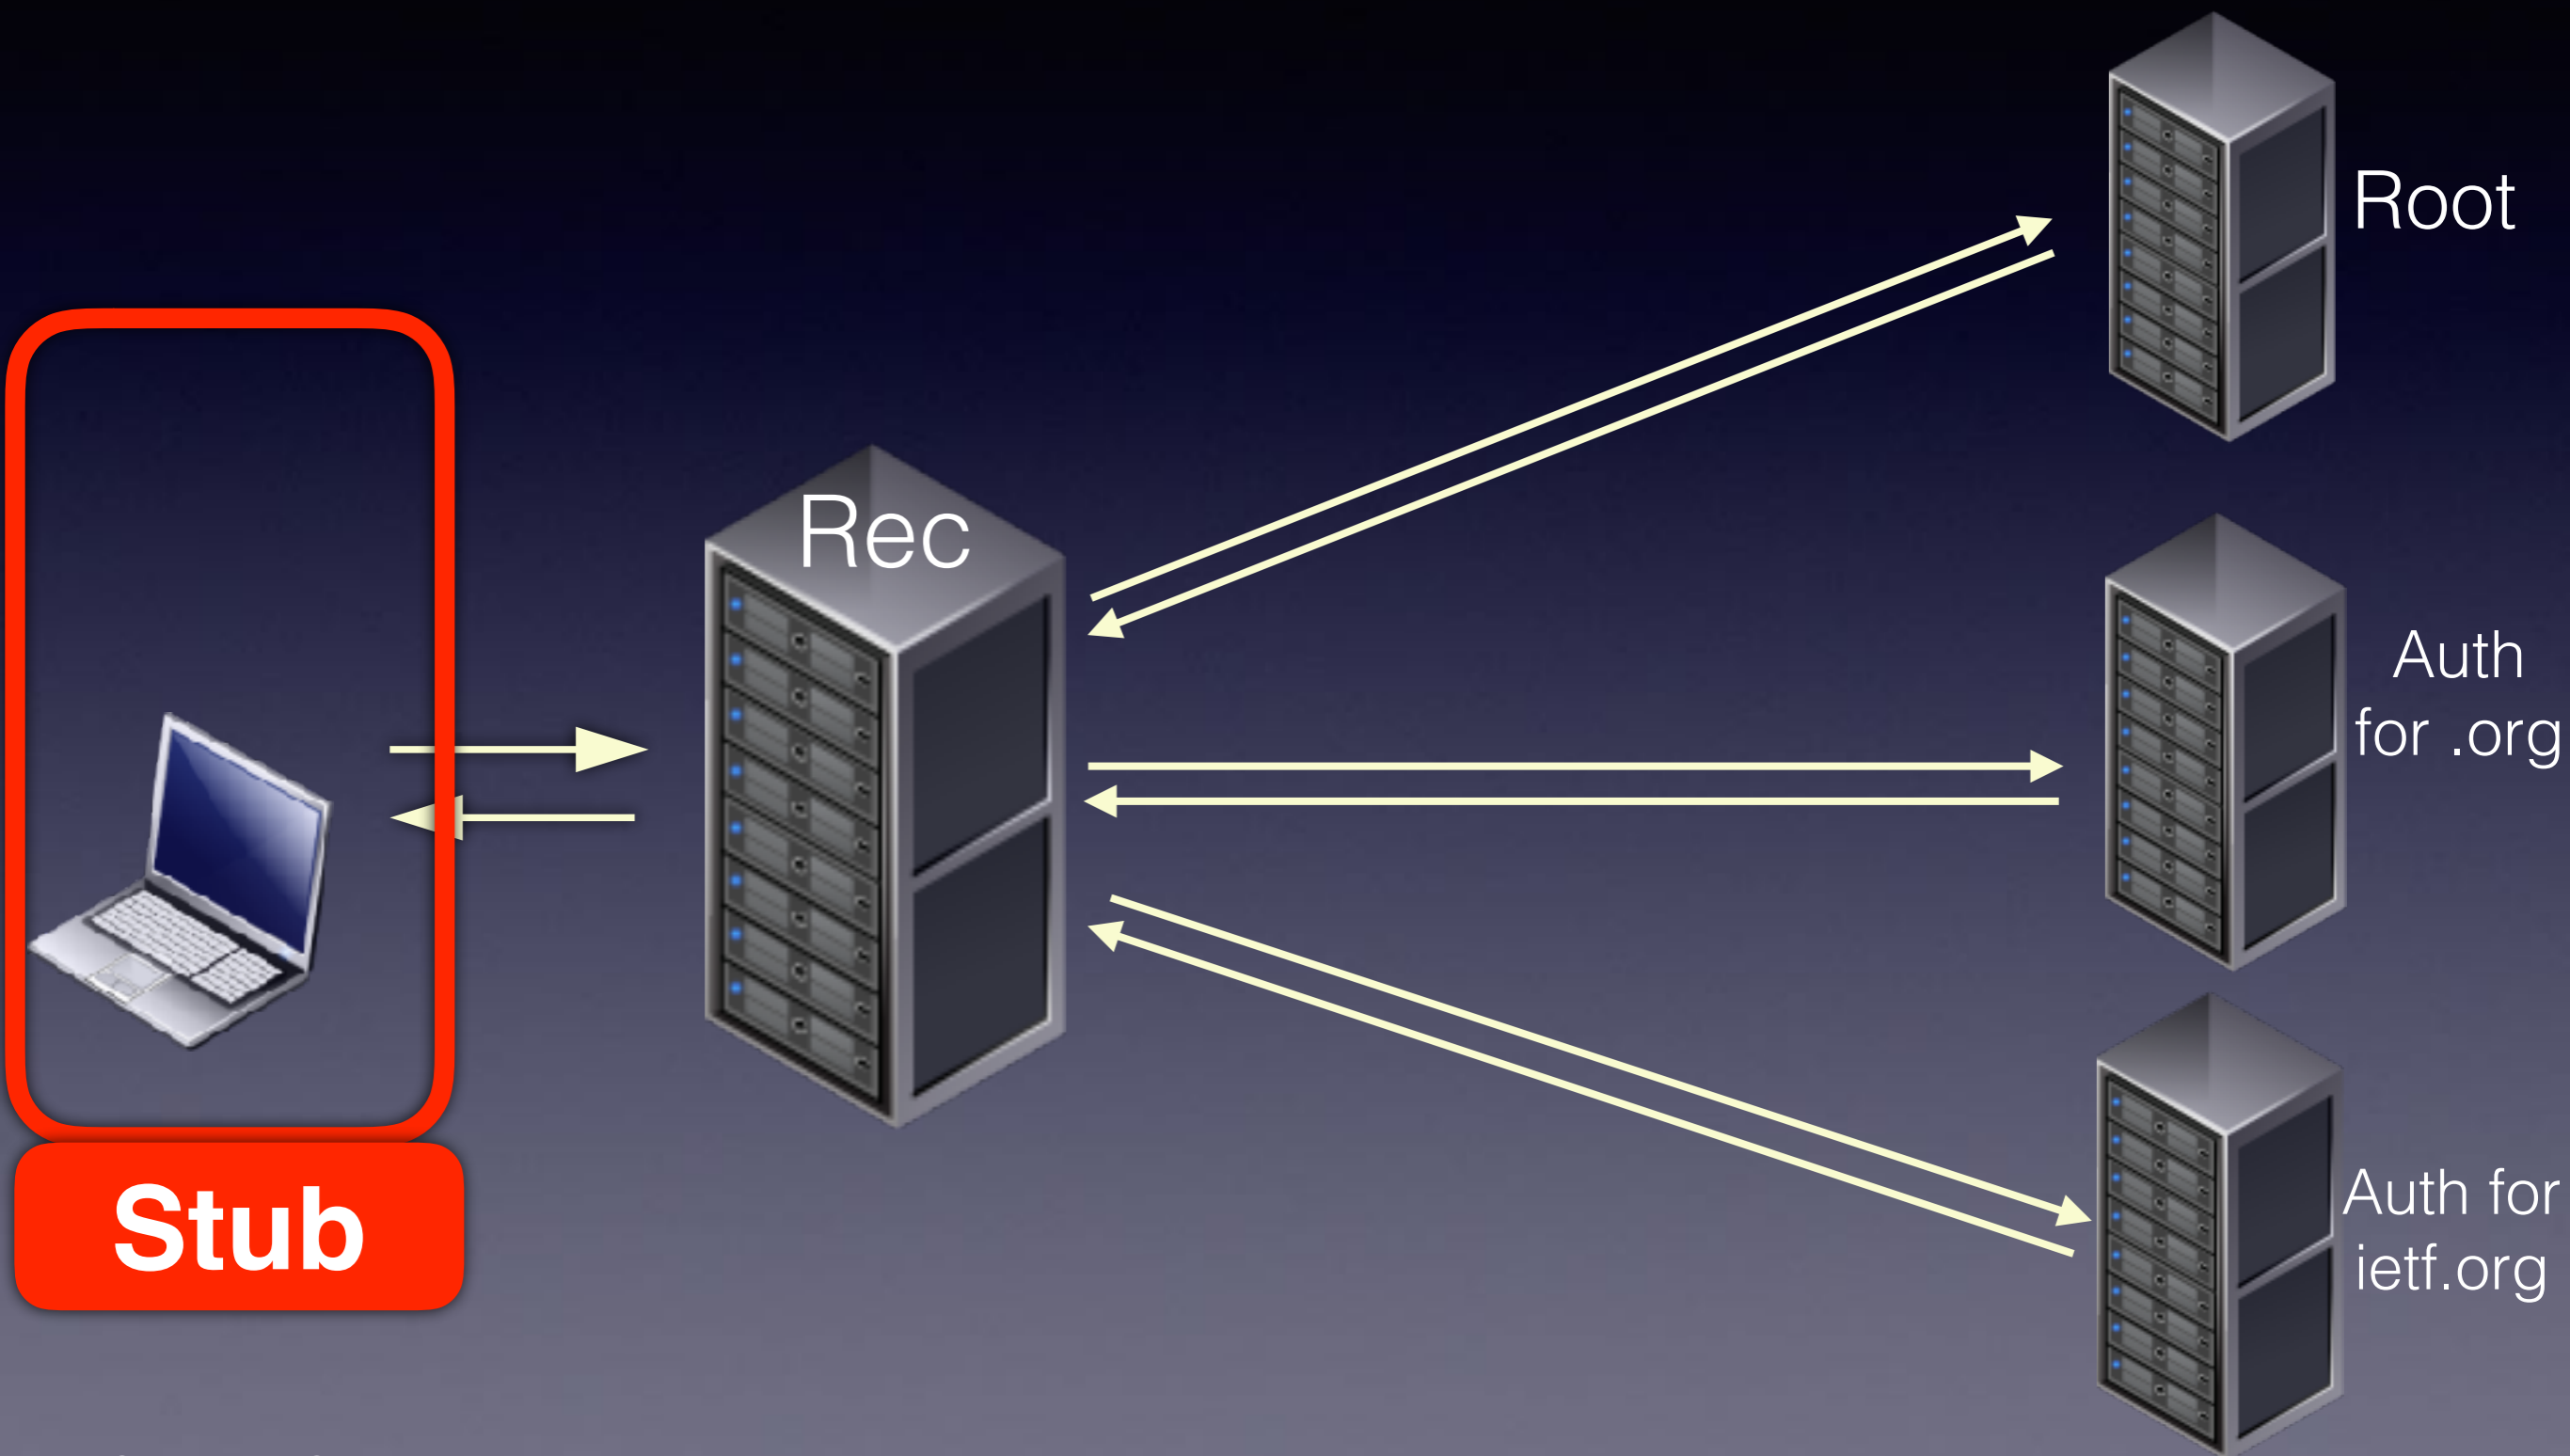

- DNS is 30 year old! [RFC1034/5 (1987)]
 - Original design: availability, redundancy and speed!
 - DNS is an 'enabler'
- DNS standards:
 - UDP (99% of traffic to root)
 - TCP only for 'fallback' (pre 2010)
- Perception: The DNS is public, right? It is not sensitive/personal information....it doesn't need to be protected/encrypted

DNS sent in clear text
NSA: **MORECOWBELL**

DNS Disclosure Example 1

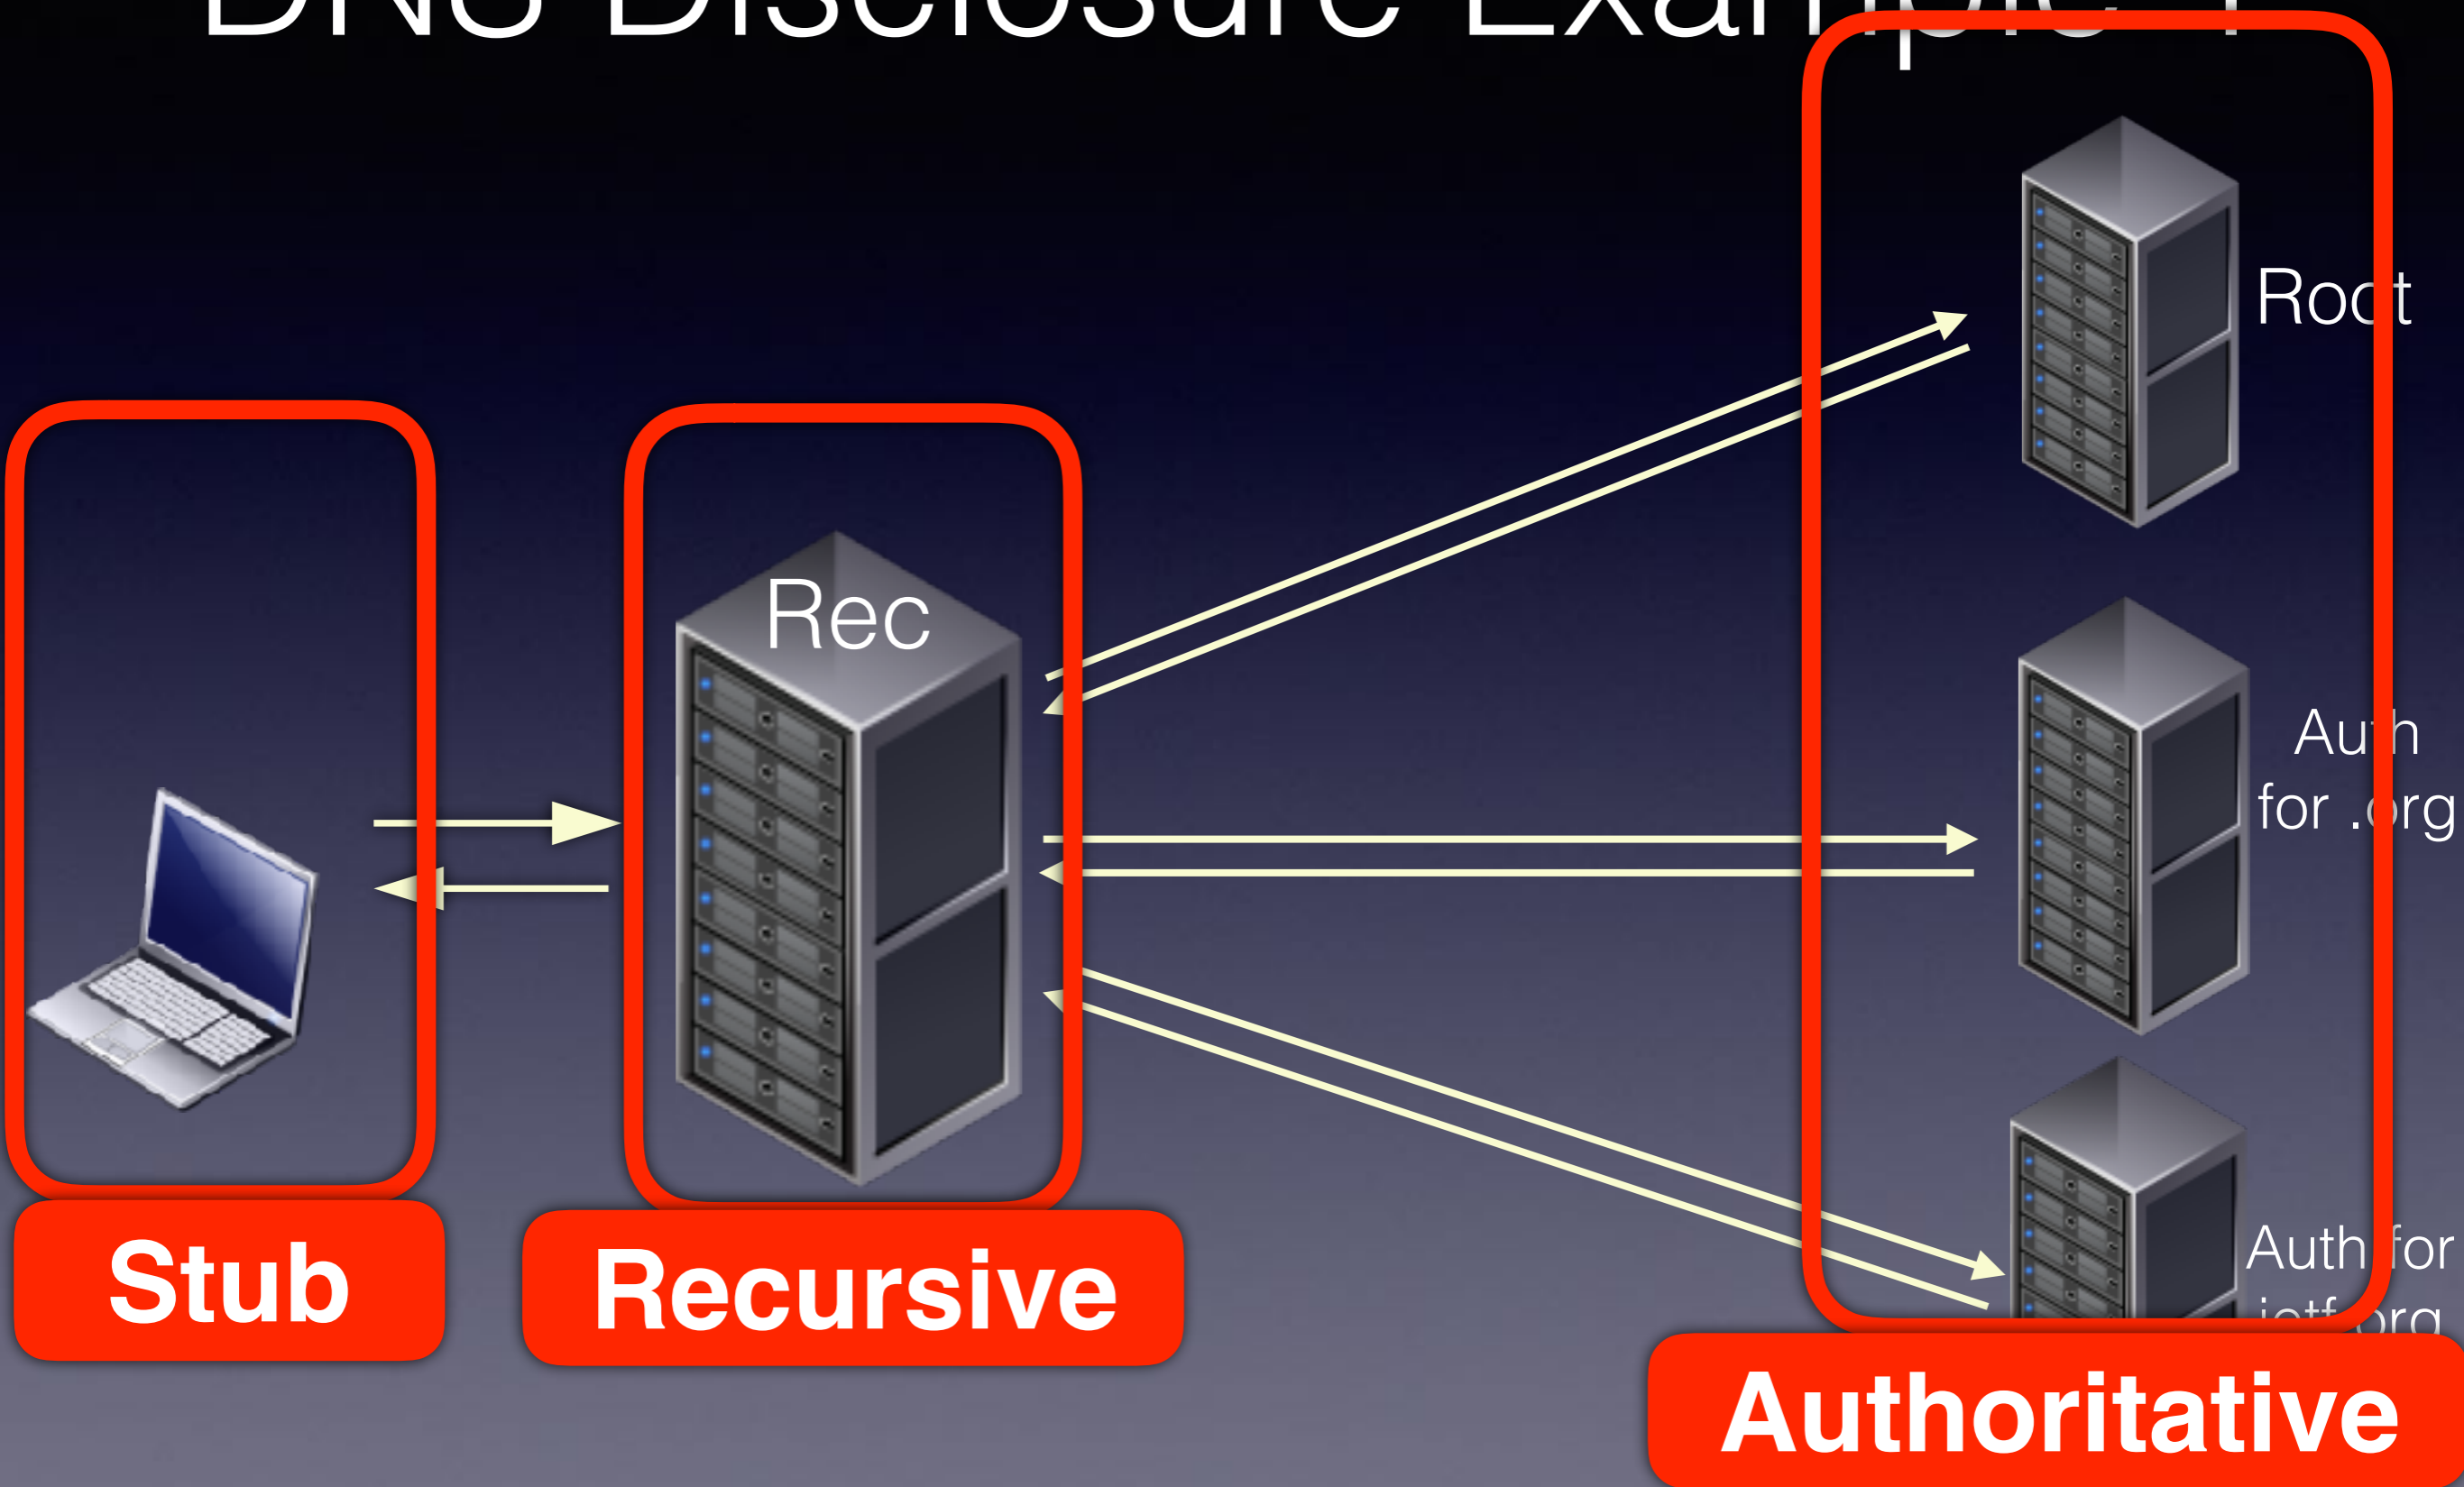

DNS Disclosure Example 1

DNS Disclosure Example 1

DNS Disclosure Example 1

DNS Disclosure Example 1

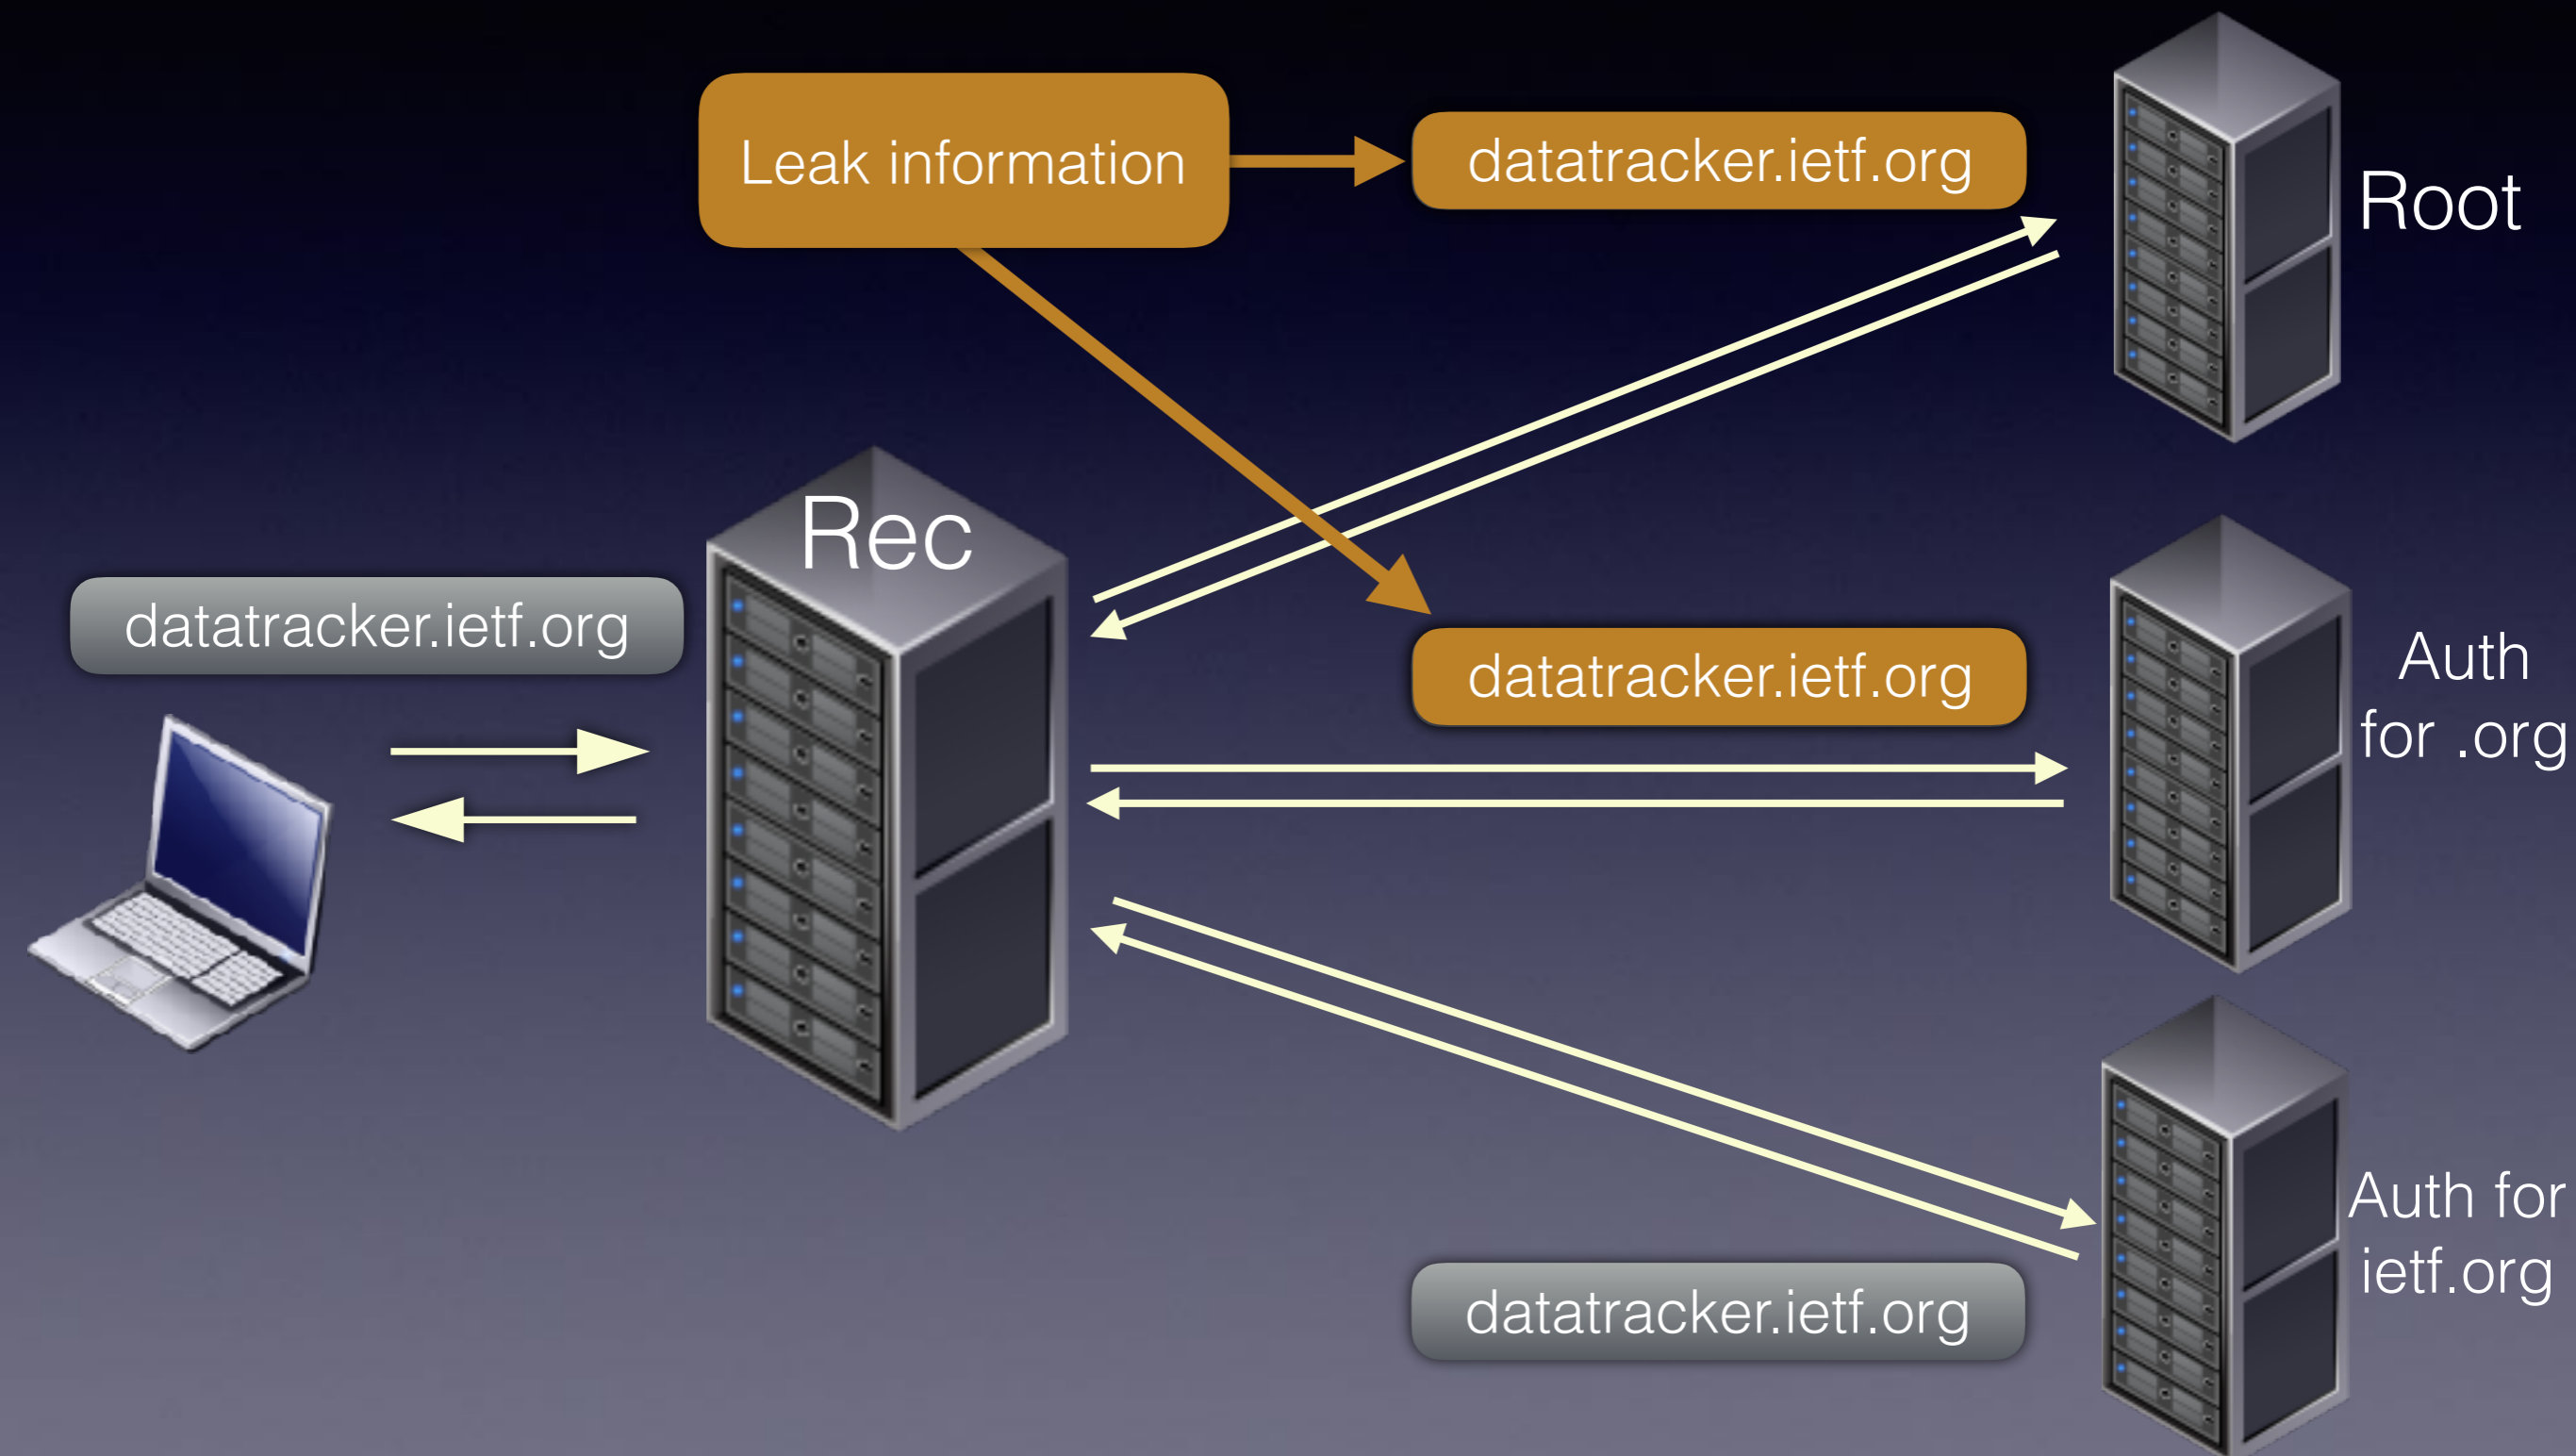

DNS Disclosure Example 1

DNS Disclosure Example 1

DNS Disclosure Example 1

EDNS0 problem

- **RFC6891** (2013): Extension Mechanisms for DNS (EDNS0)

Intended to enhance DNS protocol capabilities

- But.... mechanism enabled addition of **end-user data** **into** DNS queries (non-standard options)

EDNS0 problem

- **RFC6891** (2013): Extension Mechanisms for DNS (EDNS0)

Intended to enhance DNS protocol capabilities

- But.... mechanism enabled addition of **end-user data** **into** DNS queries (non-standard options)

ISP justification: Parental Filtering (per user)

CDN justification: Faster content (geo location)

DNS Disclosure Example 2

Parental Filtering

ietf.org ?
[00:00:53:00:53:00]

Stub

CPE

Rec

Auth

[User src address]
MAC address or id
in DNS query

DNS Disclosure Example 2

Parental Filtering

CDN Geo-location

ietf.org ?
[00:00:53:00:53:00]

? ietf.org ?
[192.168.1]

Stub

Rec

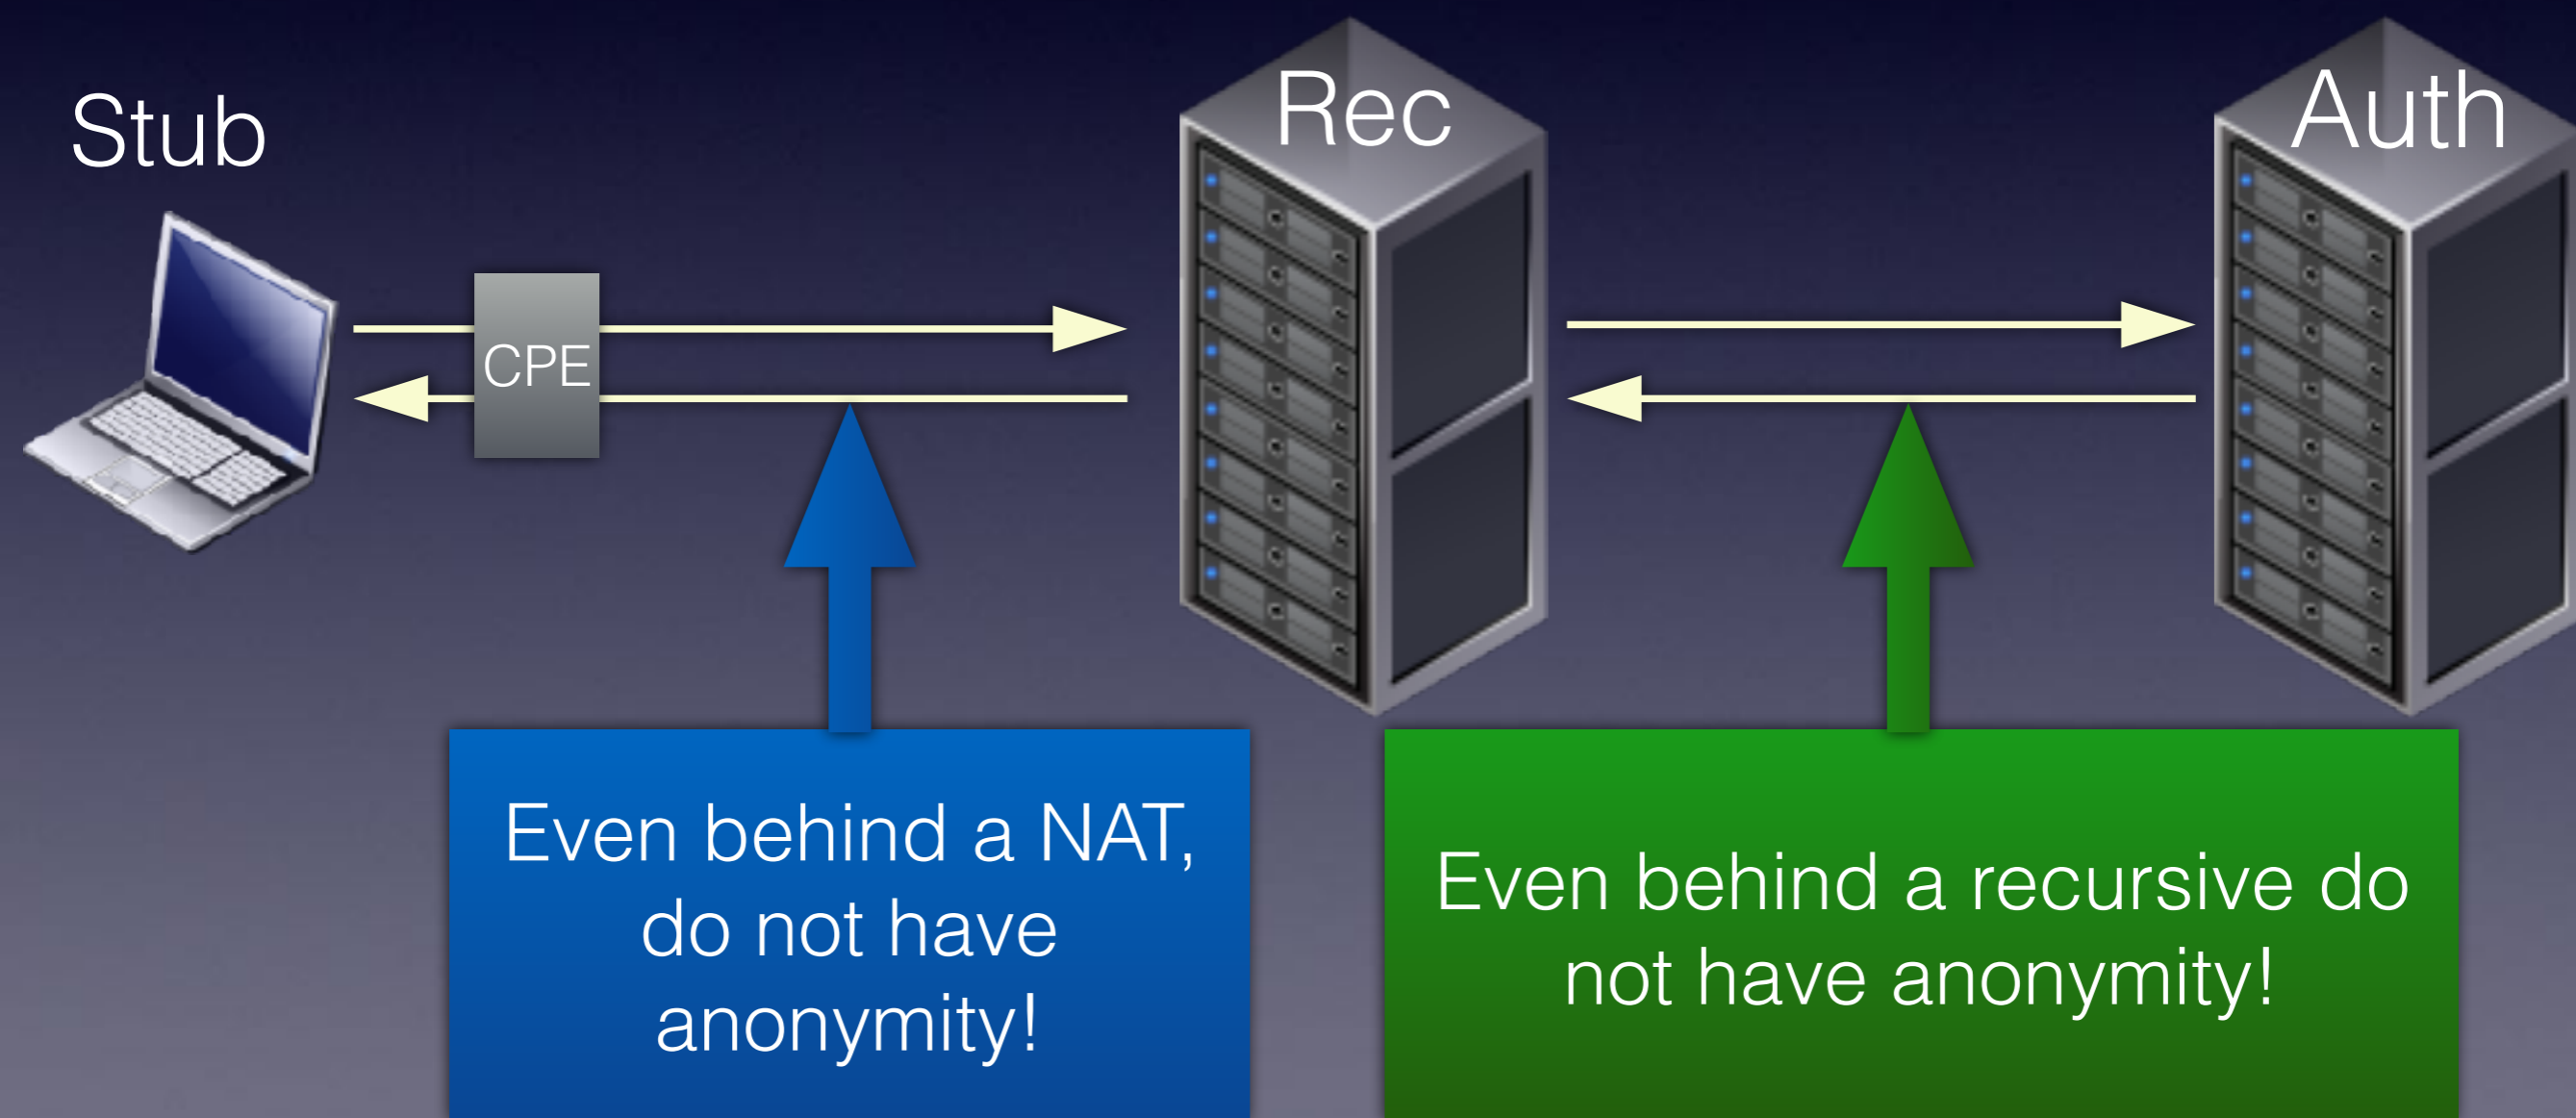

Auth

CPE

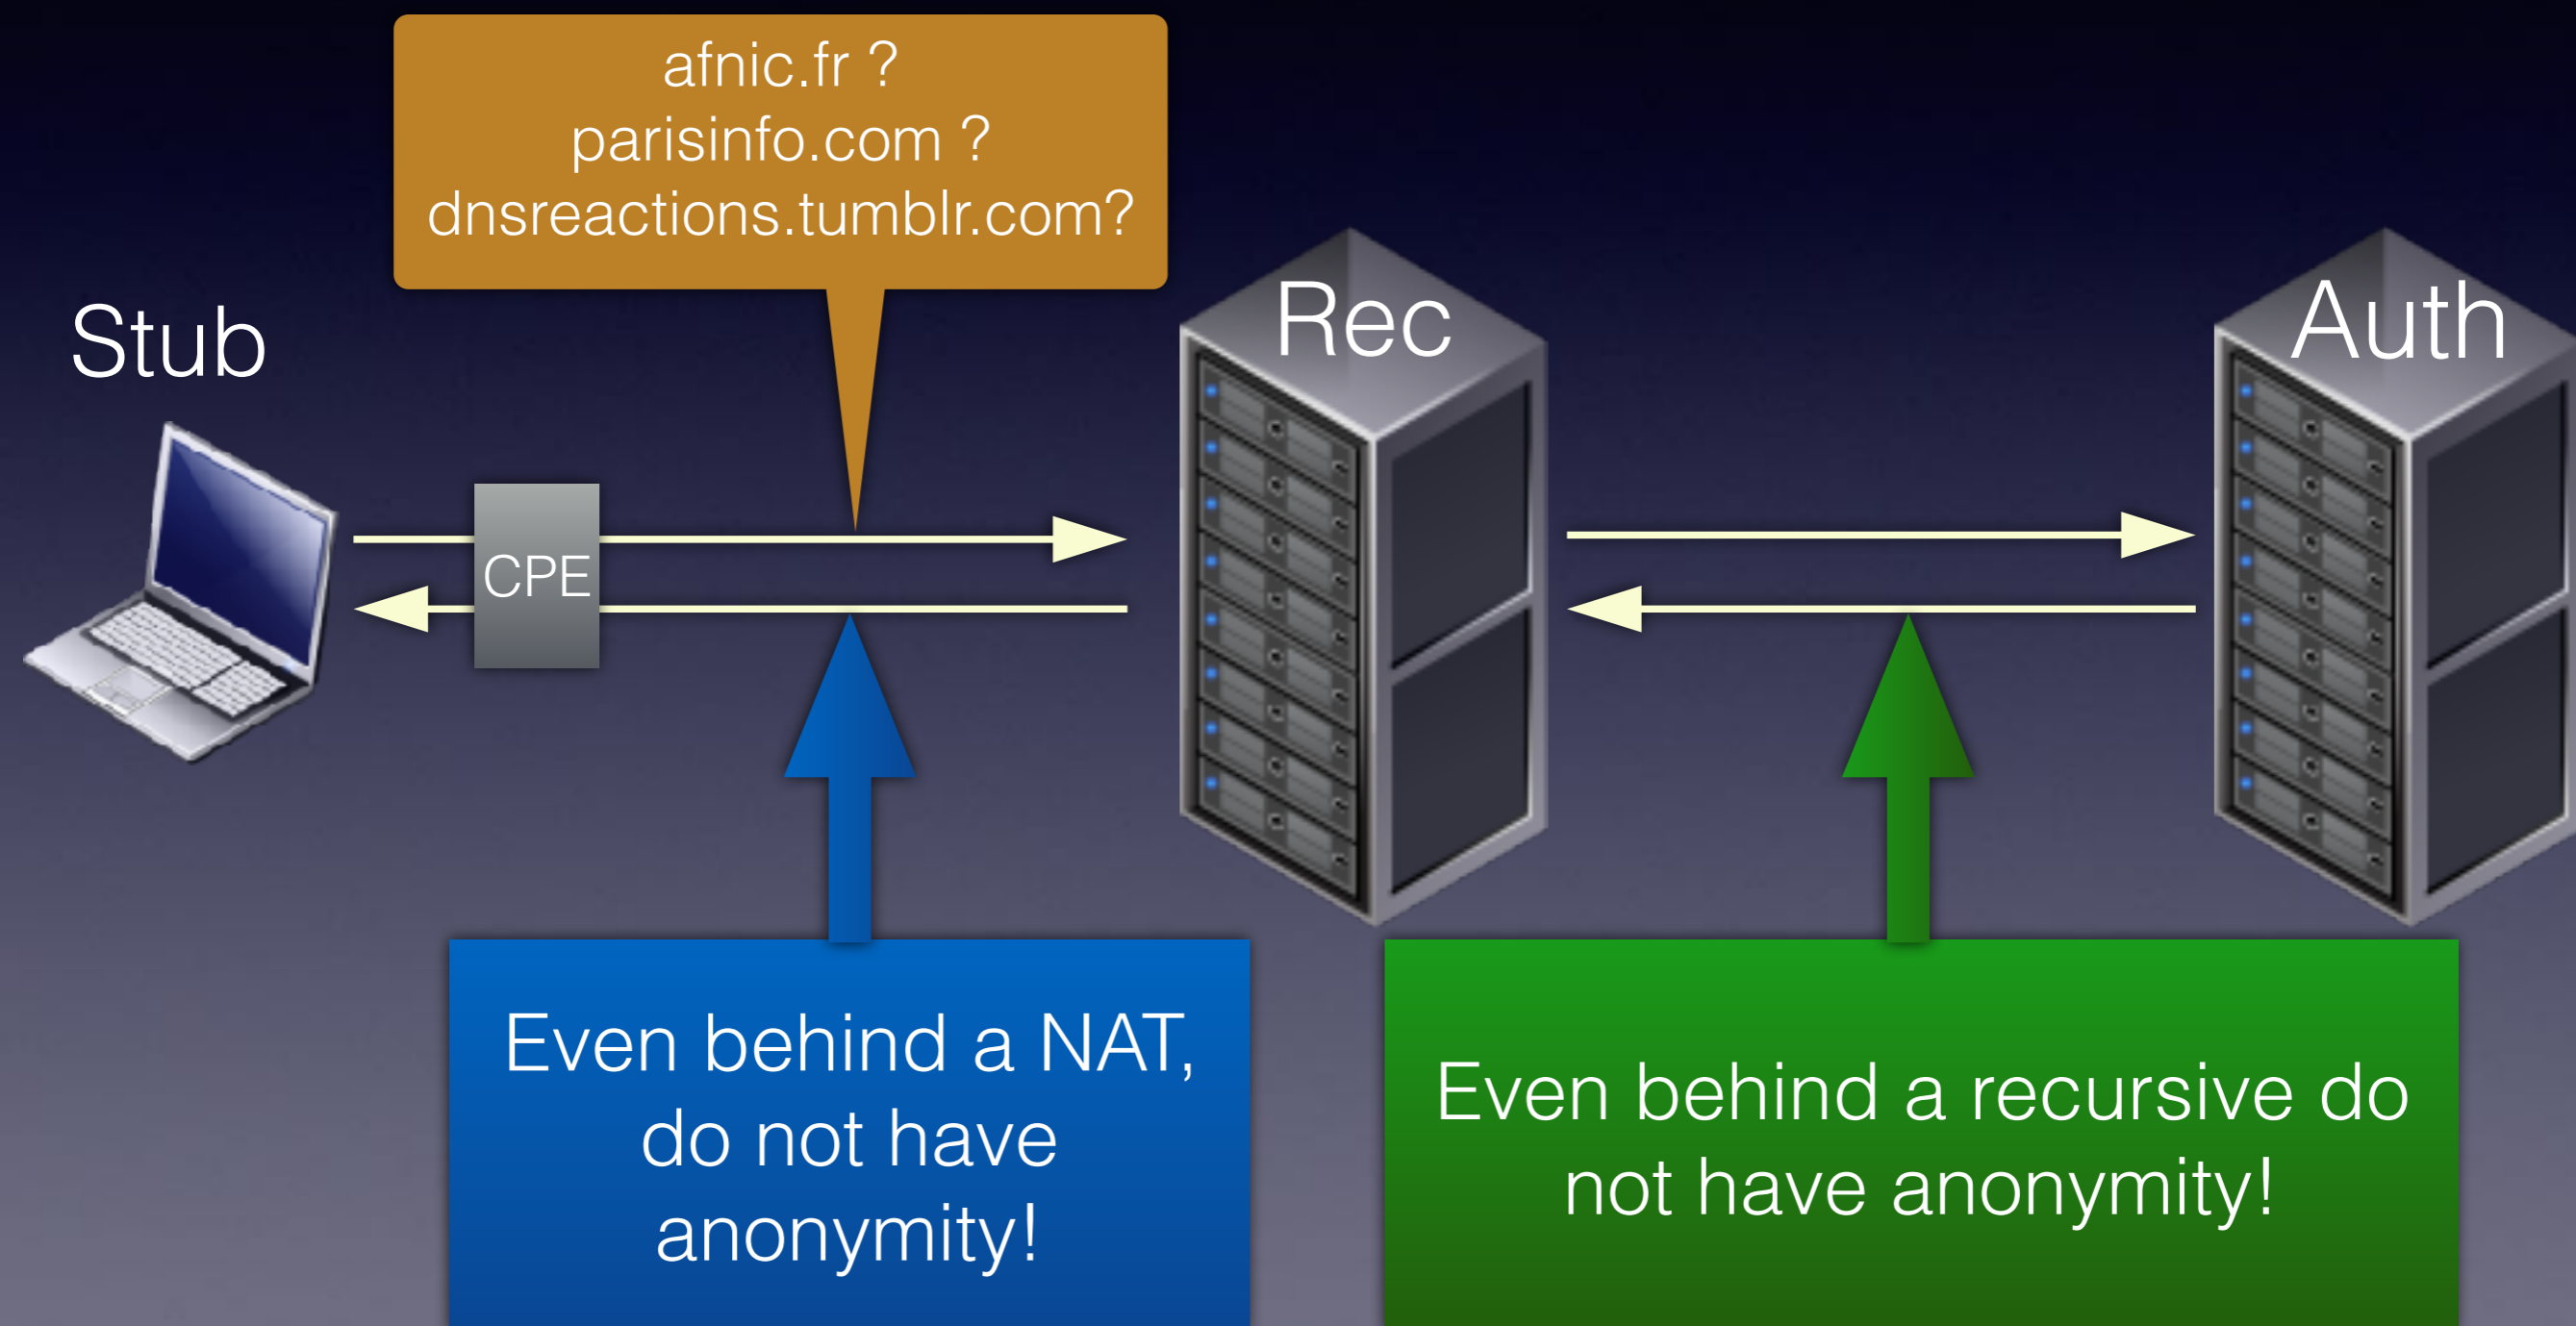

[User src address]
MAC address or id
in DNS query

Client Subnet (RFC7871)
contains source subnet
in DNS query

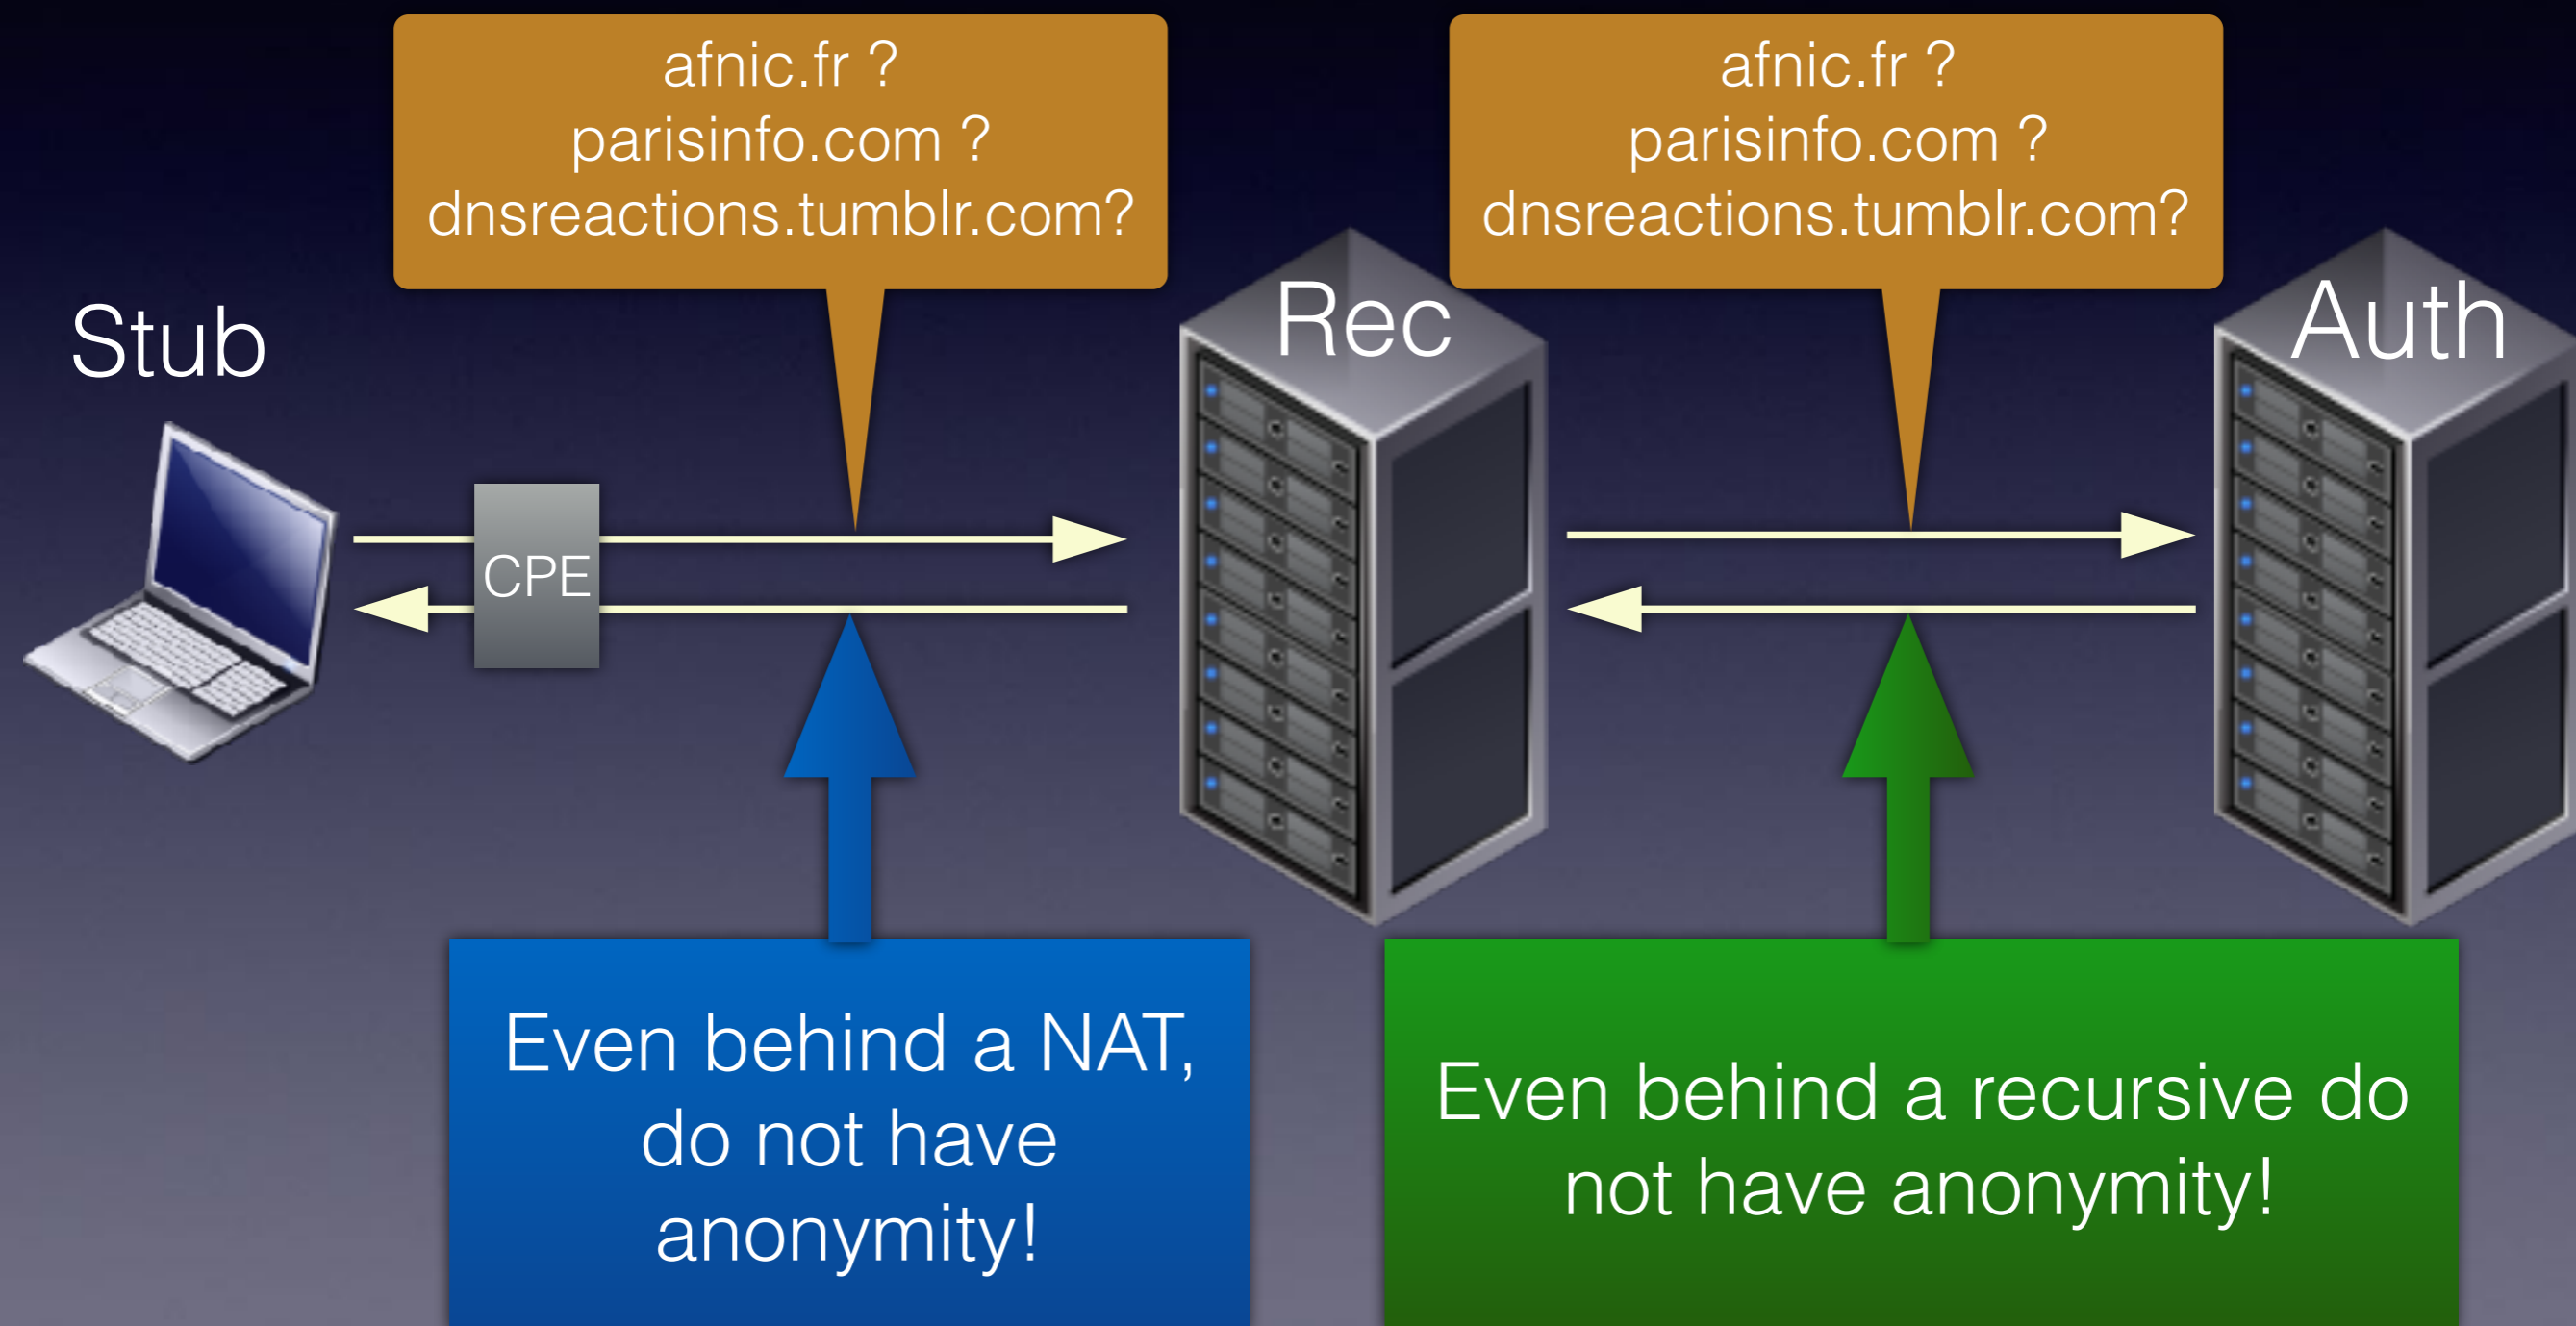

DNS Disclosure Example 2

DNS Disclosure Example 2

DNS Disclosure Example 2

DNS: It's not just for names

- MX records (email domain)
- SRV records (services)
- OPENPGPKEY (email addresses)
- ...this is only going to increase....

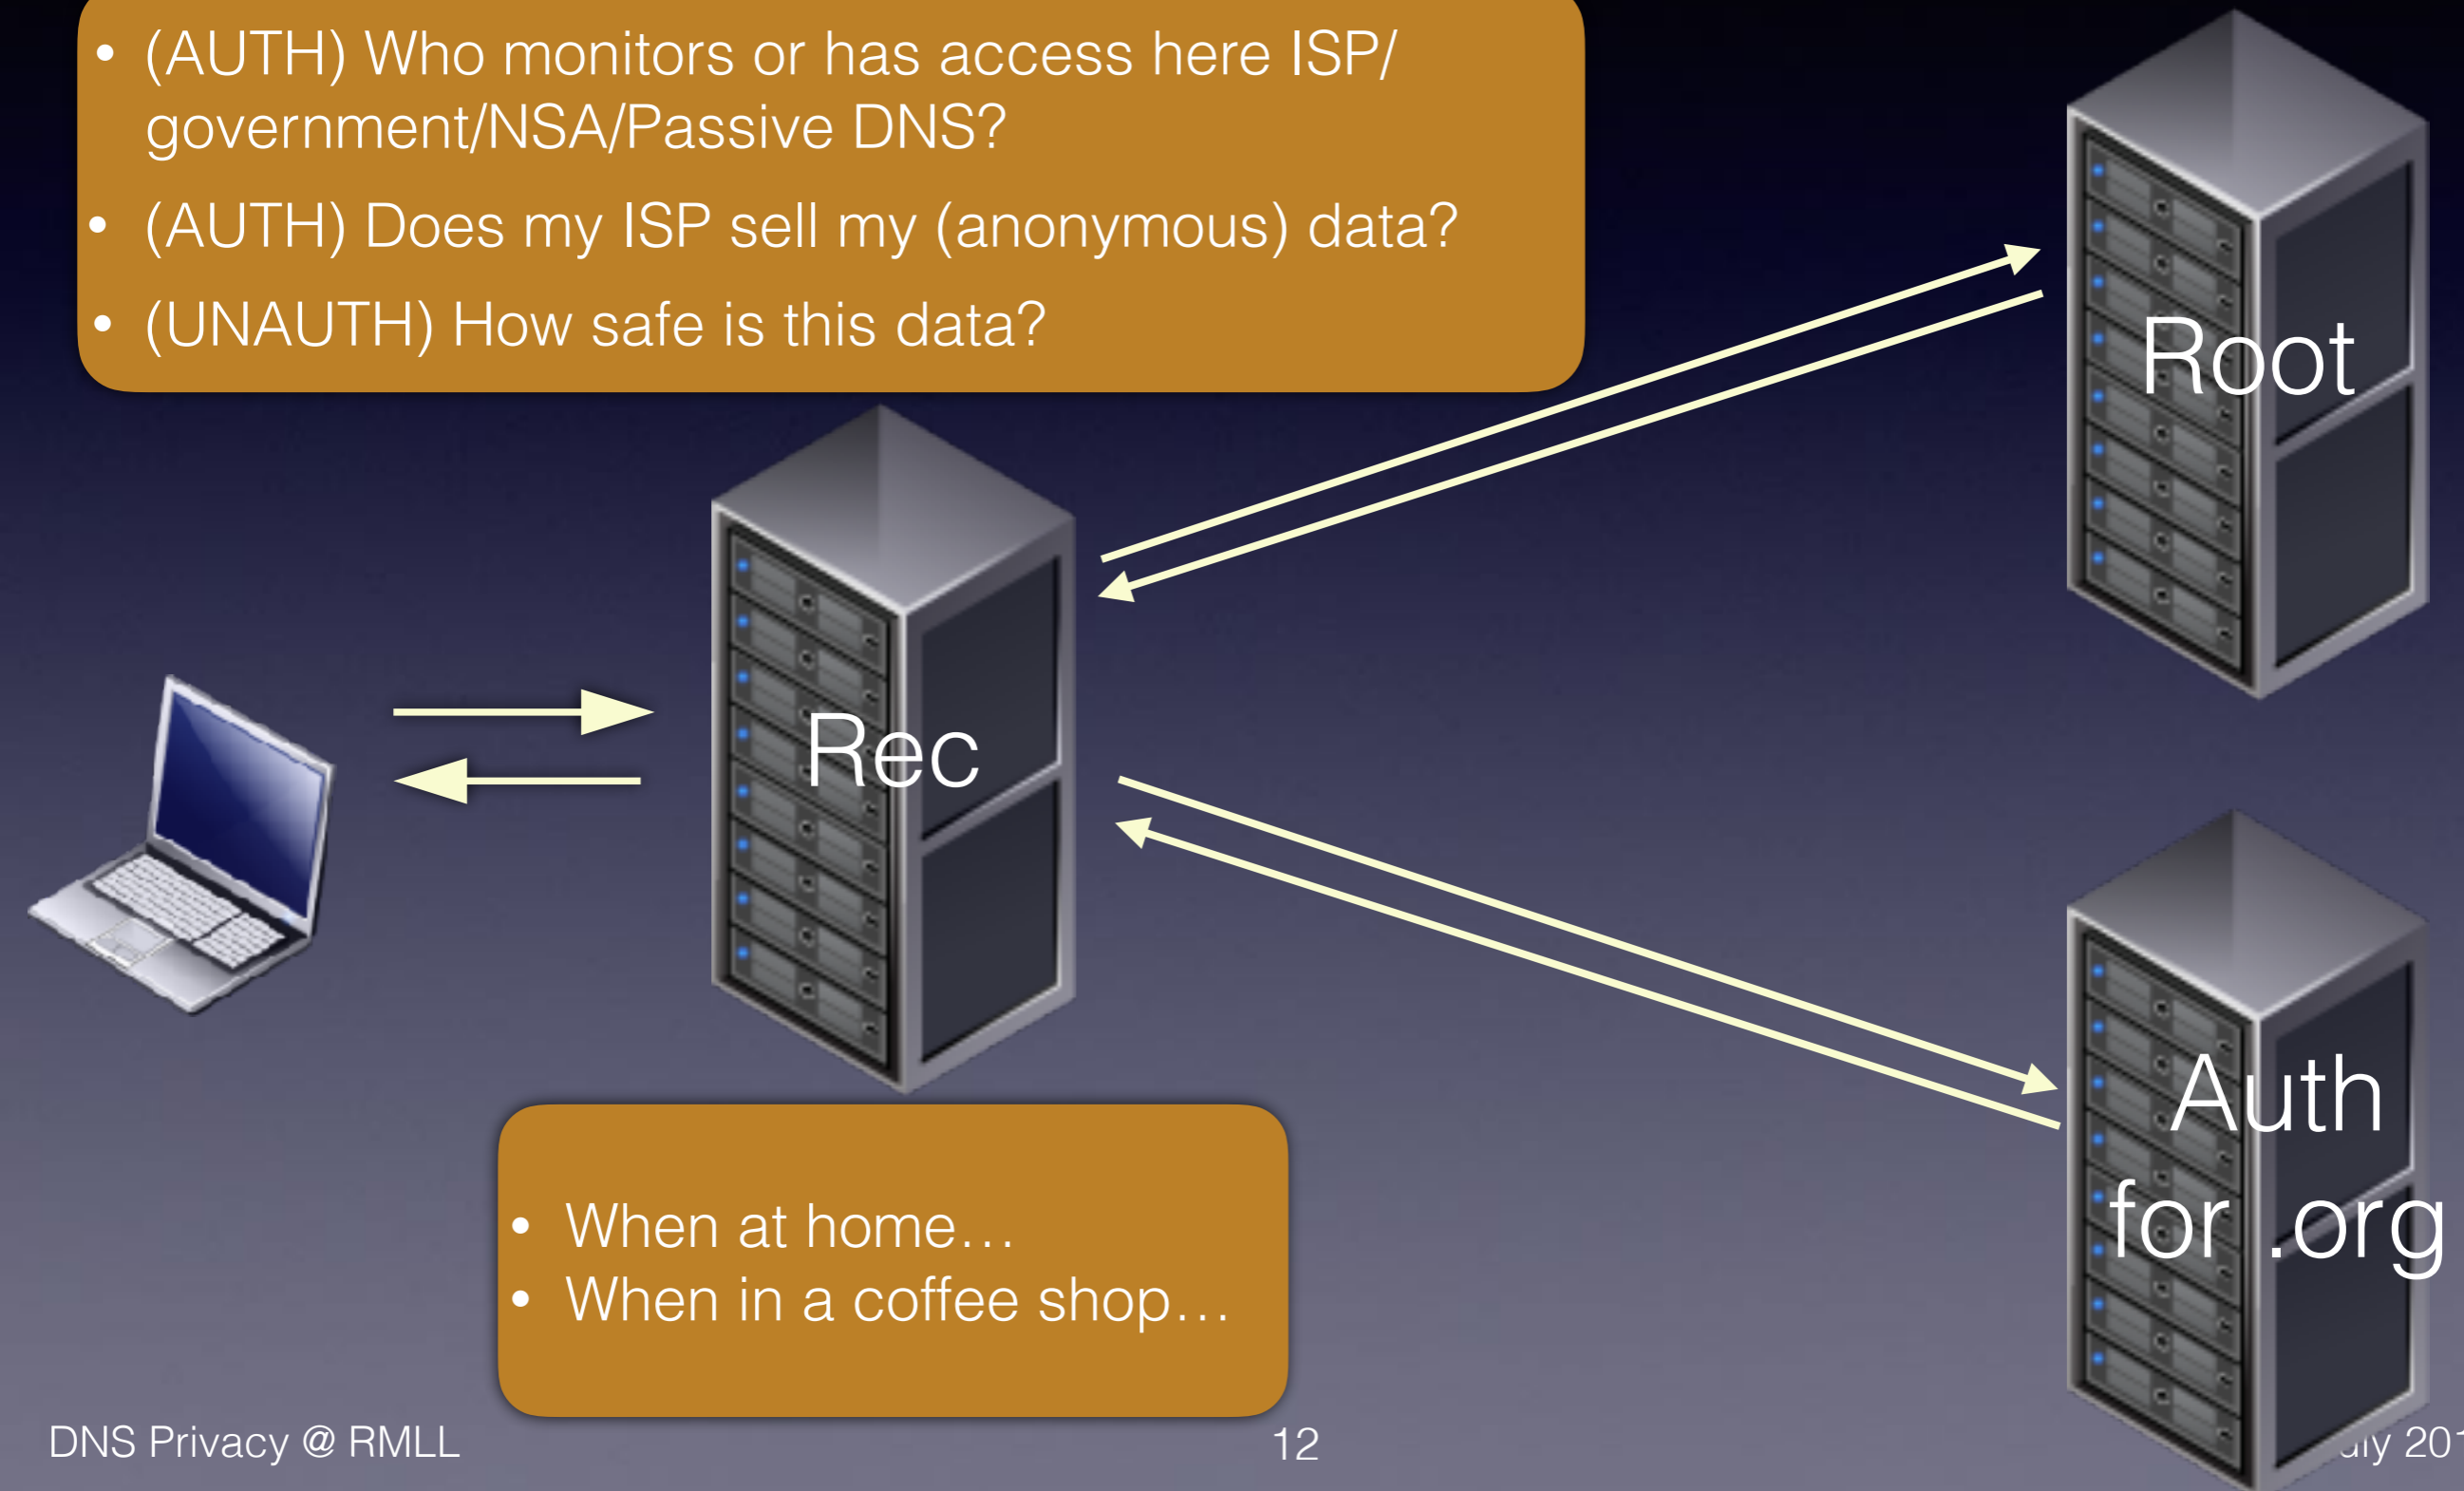

DNS: It's not just for names

- MX records (email domain)
- SRV records (services)
- OPENPGPKEY (email addresses)
- ...this is only going to increase....

DNS Disclosure Example 3

- (AUTH) Who monitors or has access here ISP/ government/NSA/Passive DNS?
- (AUTH) Does my ISP sell my (anonymous) data?
- (UNAUTH) How safe is this data?

- When at home...
- When in a coffee shop...

DNS Disclosure Example 3

- (AUTH) Who monitors or has access here ISP/ government/NSA/Passive DNS?
- (AUTH) Does my ISP sell my (anonymous) data?
- (UNAUTH) How safe is this data?

Who monitors or has access here?

Who monitors or has access here?

- When at home...
- When in a coffee shop...

DNS - leakage

- Basic problem is leakage of meta data
 - Allows fingerprinting and re-identification of individuals
- Even without user meta data traffic analysis is possible based just on timings and cache snooping
- Operators see (and log) your DNS queries

DNS - leakage

- Basic problem is leakage of meta data
 - Allows fingerprinting and re-identification of individuals
- Even without user meta data traffic analysis is possible based just on timings and cache snooping
- Operators see (and log) your DNS queries

DNS Risk Matrix

	In-Flight		At Rest	
Risk	Stub => Rec	Rec => Auth	At Recursive	At Authoritative
Passive Monitoring				
Active Monitoring				
Other Disclosure Risks e.g. Data breaches				

DPRIVE WG et al.

IETF DPRIVE WG

- DPRIVE WG create in 2014

Charter: Primary Focus is Privacy for Stub to recursive

- **Why not tackle whole problem?**
 - Don't boil the ocean, stepwise solution
 - Stub to Rec reveals most information
 - Rec to Auth is a particularly hard problem

Problem statement: RFC 7626

DNS Privacy Considerations:
Expert coverage of risks throughout DNS ecosystem

- **Rebuts “alleged public nature of DNS data”**
 - The **data** may be public, but a DNS **‘transaction’** is not/should not be.

“A typical example from outside the DNS world is: the web site of Alcoholics Anonymous is public; the fact that you visit it should not be.”

Stub/Rec Encryption Options

	Pros	Cons
STARTTLS	<ul style="list-style-type: none">• Port 53• Known technique• Incrementation deployment	<ul style="list-style-type: none">• Downgrade attack on negotiation• Port 53 - middleboxes blocking?• Latency from negotiation
TLS (new port)	<ul style="list-style-type: none">• New DNS port (no interference with port 53)• Existing implementations	<ul style="list-style-type: none">• New port assignment• Scalability?
DTLS (new port)	<ul style="list-style-type: none">• UDP based• Not as widely used/ deployed	<ul style="list-style-type: none">• Truncation of DNS messages (just like UDP)<ul style="list-style-type: none">➔ Fallback to TLS or clear text✗ Can't be standalone solution

Stub/Rec Encryption Options

	Pros	Cons

Encrypted DNS 'TODO' list

1. Get a new port
2. DNS-over-TCP/TLS: Address issues in standards and implementations
3. Tackle authentication of DNS servers (bootstrap problem)
4. What about traffic analysis of encrypted traffic - msg size & timing still tell a lot!

Encrypted DNS 'TODO' list

1. Get a new port

Oct 2015 - port **853**

2. DNS-over-TCP/TLS: Address issues in standards and implementations

3. Tackle authentication of DNS servers (bootstrap problem)

4. What about traffic analysis of encrypted traffic - msg size & timing still tell a lot!

2. Fix DNS-over-TCP/TLS

Goal	How?
Optimise set up & resumption	<p><u>RFC7413</u>: TFO Fast Open <u>RFC5077</u>: TLS session resumption <u>TLS 1.3</u> (0-RTT)</p>
Amortise cost of TCP/TLS setup	<p><u>RFC7766</u> (bis of RFC5966) - March 2016: Client pipelining (not one-shot!), Server concurrent processing, Out-of-order responses</p> <p><u>RFC7828</u>: Persistent connections (Keepalive)</p>
Servers handle many connections robustly	<p>Learn from HTTP world!</p>

3. Authentication in DNS-over-(D)TLS

- Internet-Draft: Usage Profiles
 - Strict
 - Opportunistic
- Authentication:
 - Name or SPKI pin (requires config)
 - DANE (I-D: TLS DNSSEC Chain Extension)

3. Authentication in DNS-over-(D)TLS

- Internet-Draft: Usage Profiles
 - Strict  (Encrypt & Authenticate) or Nothing
 - Opportunistic
- Authentication:
 - Name or SPKI pin (requires config)
 - DANE (I-D: TLS DNSSEC Chain Extension)

3. Authentication in DNS-over-(D)TLS

- Internet-Draft: Usage Profiles

- Strict

(Encrypt & Authenticate) or Nothing

- Opportunistic

1. Encrypt & Authenticate then
2. Encrypt then
3. Clear text

- Authentication:

- Name or SPKI pin (requires config)

- DANE (I-D: TLS DNSSEC Chain Extension)

DPRIVE Solution Documents (stub to recursive)

Document	Date	Topic
<u>RFC7858</u>	May 2016	DNS-over-TLS
<u>RFC7830</u>	May 2016	4. EDNS0 Padding Option
<u>RFC8094</u>	Feb 2017	DNS-over-DTLS
<u>draft-ietf-dprive-dtls-and-tls-profiles</u>	IESG LC	Authentication for DNS-over-(D)TLS

*Category: Experimental

Other work....

DNS Disclosure Example 1

RFC7816: QNAME Minimisation

DNS-over-HTTP(S)

Avoids e.g. port
853 blocking

- Google: DNS-over-HTTPS (non-standard)
- Standards are in flux (many drafts....)
- DNS wire-format over HTTP (tunnelling)
- DNS over HTTPS (query origination)

Implementations
exist

Mix HTTPS/2
and DNS on one
connection

DNS-over-QUIC

- DNS over dedicated QUIC connections
 - QUIC is a developing open source protocol (from Google) that runs over UDP (HTTPS/2-like)
 - **~35% of Google's egress traffic**
(~7% of Internet traffic)
 - **Reliable**, low latency, performant
 - Source address validation, no MTU limit
 - **Encrypted**

DNS Data handling

- Do you read the small print of your ISPs contract?
- More work/research needed in this area
 - **Monitoring** of government policy and practice
 - **Transparency** from providers on policy and breaches
 - Methods for **de-identification** of user data (e.g. DITL)
 - **'PassiveDNS'** data used for research/security

DNS Data handling

- Do you read the small print of your ISPs contract?
- More work/research needed in this area

Not always
technical solution:
Needs more work!

- Mon
- Tran
- Meth
- 'PassiveDNS' data used for research/security

Risk Mitigation Matrix

	In-Flight		At Rest	
Risk	Stub => Rec	Rec => Auth	At Recursive	At Authoritative
Passive monitoring	Encryption (e.g. TLS, HTTPS)	QNAME Minimization		
Active monitoring	Authentication & Encryption			
Other Disclosure Risks e.g. Data breaches			Data Best Practices (Policies) e.g. De-identification	

DNS Privacy Implementation & Deployment

dnspriavacy.org

- DNS Privacy Project homepage
- **Who?** Sinodun, NLnet Labs, Salesforce, ...
(plus various grants and individual contributions)
- **What?** Point of reference for DNS Privacy services
 - Quick start guides for operators & end users
 - Ongoing work - presentations, IETF, Hackathons
 - Tracking of DNS-over-TLS experimental servers

Server Side Solutions

- Recursive (open source) implementations
 - *Unbound, Knot Resolver* support DNS-over-TLS
- Using a pure TLS load balancer (with e.g. *BIND*)
 - *NGINX, HAProxy, stunnel, docker image*
 - Requested support in *dnsmdist*
- Let's Encrypt certificate management automation

DNS-over-TLS Servers

(all using Open Source)

Hosted by	Notes
NLnet Labs	Unbound
Surfnet (Sinodun)	BIND + HAProxy BIND + nginx
UncensoredDNS	Unbound
dns.cmrg.net	Knot Resolver

10 at last count - find details at: [DNS Test Servers](#)

Server monitoring

Project dnsprivacy-monitoring

* Green indicates success

* Red indicates failed test (this might result from non DNS related issues such server being off line, blocking from the probe location, etc.) Note that the 'Strict mode' tests could fail for a number of reasons including incorrect credentials, self-signed certificates for name only authentication, incompatible TLS version or Cipher suites, etc. The console log of the test may give more information.

* Grey indicates test not run (e.g. due to lack of available transport or the lack of the SPKI pin)

Authentication information is taken from <https://dnsprivacy.org/wiki/display/DP/DNS+Privacy+Test+Servers>

These tests use Stephane Bortzmeyer's nagios plugin - see <https://github.com/bortzmeyer/monitor-dns-over-tls>

Configuration Matrix		Responds over TLS	Strict mode - Name only	Strict mode - SPKI only	Certificate expiry > 0 days	Certificate expiry > 14 days	QNAME minimisation used

Stubby

- A open source privacy enabling stub resolver:
[User Guide](#)
- Available in [getdns](#) (1.1.1 release) - open source
 - Run as daemon handling requests
 - Configure OS DNS resolution to point at *localhost*
 - DNS queries then proxied over TLS
 - Comes with config for experimental servers

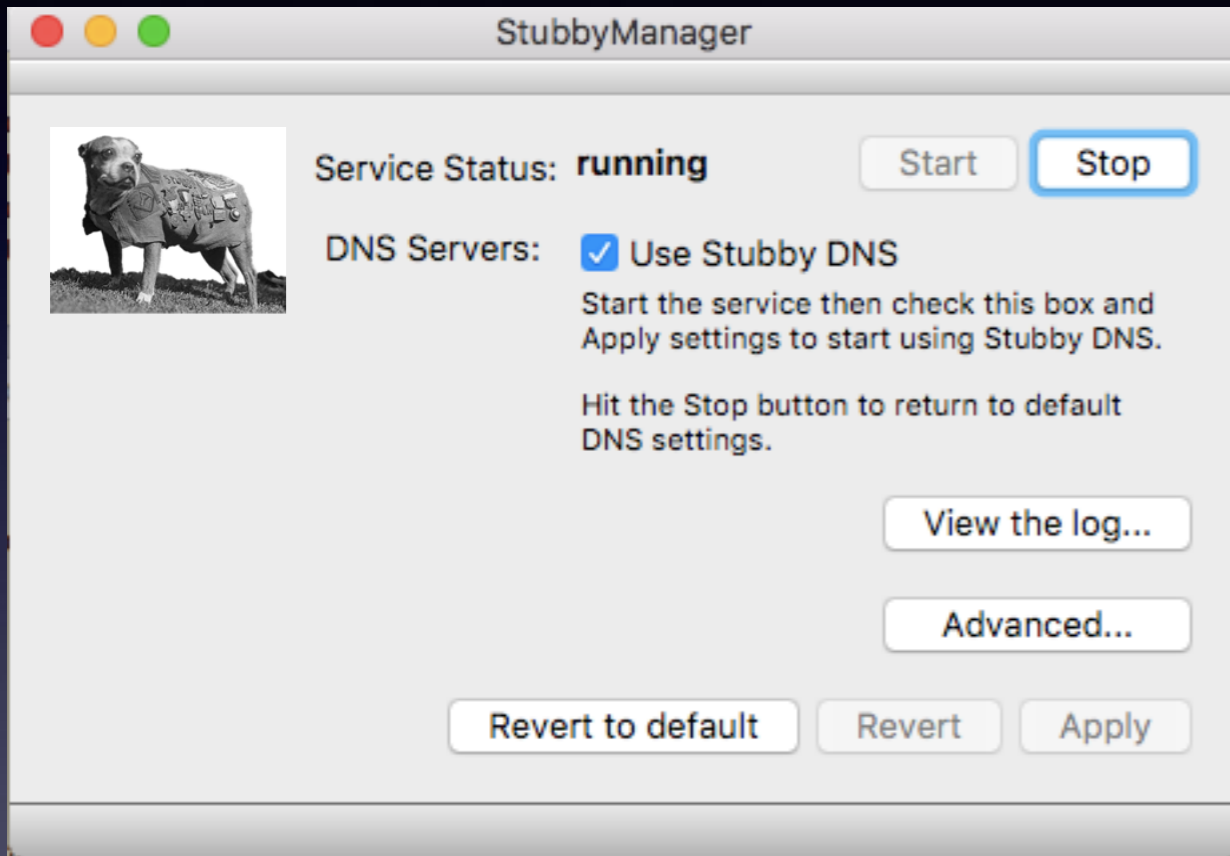

Stubby Status

- Command line tool - for 'advanced' users
 - Supports name and SPKI pinset authentication
 - Strict and Opportunistic profiles
- Homebrew formula, docker image, packages and macOS UI on the way..... (DNSSEC)

```

Stubby Usability

- DNS Privacy is a new paradigm for end users
- End users are a new paradigm for DNS people!
- **‘Usable Security’**: Good GUIs aren’t enough - users still struggle with the basics if they don’t understand what they are doing (HTTPS, PGP, DNSSEC)
- DNS Privacy uptake critically dependant on clients being usable + successful

Key challenges

1. Awareness!
2. Clients: OS integration of (more) client solutions
3. Usable client solutions for non-technical users
4. Increased deployment (anycast deployments)
5. Operator transparency in DNS data handling
6. Recursive to Authoritative....

Summary

- DNS Privacy is a real problem and more relevant than ever
- Active work on the large solution space
- Can use DNS Privacy today using Stubby & current experimental recursive servers
- More DNS Privacy services on the way...

Thank you!

Any Questions?
